

Making earth cleaner.

With depleting fossil fuel reserves, the need of renewable energy is increasing to meet the power demands. With increasing solar installations the need of water to clean solar panels is also increasing. Several billion liters of clean water is used annually to clean these solar panels across globe.

Our robots eliminate the requirement of water for cleaning these solar plants, while boosting power generation and ensuring peak production. The best in class design and fabrication makes it them one of the lightest in their categories.

S200

Lightweight. Effective. Autonomous
